

TABLE 6
INSTRUMENTAL VARIABLE ESTIMATES OF INTENSIVE MANAGEMENT AND SPENDING ON
SURVIVAL, BY SURGICAL INTENSITY OF HOSPITAL REFERRAL REGION

SAMPLE	INSTRUMENTAL VARIABLE ESTIMATES OF		
	Impact of Cath		Impact of \$1,000 on One-Year Survival
	On One-Year Survival (1)	On One-Year Cost (\$1,000s) (2)	
A. All patients:			
HRR risk-adjusted cath rate:			
Above the median (<i>N</i> = 63,771)	.256 (.061)	6.691 (3.510)	.038 (.021)
Below the median (<i>N</i> = 66,124)	.09 (.059)	9.835 (3.155)	.009 (.007)
Difference	.166 (.085)	-3.144 (4.720)	.029 (.022)
B. Patients above the median cath propensity:			
HRR risk-adjusted cath rate:			
Above the median (<i>N</i> = 32,388)	.271 (.064)	.347 (4.370)	.78 (9.820)
Below the median (<i>N</i> = 32,411)	.168 (.046)	4.962 (2.890)	.034 (.021)
C. Patients below the median cath propensity:			
HRR risk-adjusted cath rate:			
Above the median (<i>N</i> = 31,383)	.206 (.129)	16.21 (5.130)	.013 (.009)
Below the median (<i>N</i> = 33,713)	-.139 (.165)	22.064 (6.870)	-.006 (.007)

NOTE.—HRR intensity rates are computed as the risk-adjusted fixed effects from a patient-level regression of the receipt of cath on HRR fixed effects and CCP risk adjusters. Differential distance (measured as the distance between the patient's zip code of residence and the nearest catheterization hospital minus the distance to the nearest hospital) is the instrument. Each model includes all the CCP risk adjusters, and the standard errors are clustered at the level of each HRR.
