Men									
Coefficient	0.095***	0.267***	0.267***	0.019**	0.019**	0.002	0.001	0.069***	0.069***
(s.e.)	(0.001)	(0.028)	(0.028)	(0.008)	(0.008)	(0.004)	(0.004)	(0.028)	(0.029)
Number of observations	68,535	68,535	68,535	68,535	68,535	117,627	102,920	68,535	68,535
Age controls	Quartic	None	Quartic	None	Quartic	Quartic	Quartic	None	Quartic

Notes: ***, **, and * denote significance at the 1, 5, and 10 percent levels, respectively. Each coefficient comes from a separate regression. The dependent variables are log of hourly wage (Columns 1, 4, 5, 8, and 9), age of leaving full-time education (Columns 2 and 3), an indicator variable for being employed (Column 6), and an indicator variable for being self-employed (Column 7). OLS regressions in Column 1 include a quartic in age and a full set of survey year dummies. RDD regressions in Columns 2–8 include a fourth-order polynomial in school cohort, allowing for an intercept shift at the cut-off point (i.e., 1953 in France and 1958 in England and Wales). The French sample (Panel A) is constructed from the first wave of the 1990–2002 French Enquête Emploi. It includes individuals who were born in France, who belong to school cohorts 1944–1962, who left full-time education between the ages of 6 and 25, and who were aged 25–60 when surveyed. The sample from England and Wales (Panel B) is constructed from the fifth wave of the 1993–2006 Quarterly Labour Force Survey. It includes individuals who were born in England and Wales, who belong to school cohorts 1949–1967 (i.e., born between 1 September 1948 and 31 August 1967), who left full-time education between the ages of 6 and 25, and who were aged 25–60 when surveyed. The samples used in Column 6 include all individuals. The subsamples used in Column 7 are restricted to workers. The subsamples used in Columns 1–5 and 8–9 include wage earners only. Standard errors are clustered at the school cohort level.
